

FIBRE HAIR AFTERCARE ADVICE

Step-by-step guide to washing your wig

1. Prior to washing, remove all knots and tangles paying particular attention to the nape section.
2. Fill a hand bowl or sink with tepid water and a little **T-Range Shampoo** and very gently agitate your wig or hairpiece back and forth in the water.
3. Gently rinse so there are no traces of shampoo. Gently smooth through some **T-Range Softening Conditioner** to help condition the fibre.
4. Thoroughly rinse the conditioner out.
5. Pat gently with a towel to remove excess water. Never rub.
6. Place on a Polyhead to dry naturally.
7. When completely dry, spray with **T-Range Soften 'n Sheen** and style.
8. For extra hold, apply some of our **T-Range Holding spray** sparingly on piece.

Fibre hair advice and top tips!

For the best results and the prolonged life of your purchase we recommend:

Using our fantastic **T-Range Fibre** products.

Before / after wearing, spray the fibre hair lightly with **T-Range Soften 'n Sheen**, then gently remove any knots and tangles with the fingers.

Scrunched permed models must never be brushed– detangle using your fingers or a wide tooth afro comb.

If worn daily wash at least every 10 - 14 days.

Important notes

Never use intense heat on your fibre wig such as, hairdryers, ceramic irons, curling tongs- this will burn the fibres!

Never wash in hot water.

Avoid opening ovens and standing under overhead heaters whilst wearing a fibre wig.

Please note that continual wearing of a fibre wig will result in the fibre frizzing -especially if your wig is collar length or longer, the name for this is Friction Frizz.

Fibre wigs need to be replaced more frequently than human hair. The expected lifespan for a short fibre wig is 4-6 months a mid length (or bob) wig is between 3-4 months and a long wig is 2-3 months; these time frames are approximate and are based on everyday wear.

Modacrylic fibre can never be coloured or bleached.

For flexible partings on a fibre wig select a wig that has a hand knotted monofilament top finish.

Machine wefted wigs tend to have root teasing -this is produced to hide the weft line and foundation underneath.

We do not recommend you sleep in your wig, it will cut the lifespan by at least half.

A recommended way to prevent/ease friction frizz is to steam a wig, this must be done with professional guidance only.

The 2 important rules for putting on your wig correctly are to position the wig line at the front 4 fingers width from your brow bone and to ensure the tabs on each side of the wig are evenly positioned so the wig is straight.
